

PharmaRidge

Pharmacy & PPMV Management — Onboarding Guide

For proprietors, general managers, branch managers and counter staff

Every screen in this guide is a photograph of the working system, not a drawing. Figures shown are from a demonstration pharmacy.

What is in this guide

1. **Why PharmaRidge exists** — the problems it removes from your day
2. **Getting in** — signing in, and what you see first
3. **Chapter for the Owner** — the proprietor's view and powers
4. **Chapter for the Co-Owner** — a second proprietor, and what changes
5. **Chapter for the General Manager** — running every shop
6. **Chapter for the Branch Manager** — running one shop
7. **Chapter for Counter Staff** — selling, the till, attendance
8. **Money that is not in the till** — the branch safe
9. **When you have no change** — the "no N100 note" problem, solved
10. **Who can do what** — the complete permission tables
11. **What it costs, and what it saves**
12. **How PharmaRidge differs** from the software you have seen before

A note on money. PharmaRidge writes amounts as N1,500.00 rather than with the naira symbol (₦). This is deliberate: the naira sign does not print on many thermal receipt printers and older Android phones, and a receipt that shows a box instead of a currency sign is worse than plain letters.

1. Why PharmaRidge exists

Most pharmacy software is a cash register with reports bolted on. PharmaRidge is built around the things that actually cost a Nigerian pharmacy money.

The five leaks

The leak	What PharmaRidge does about it
Expired stock	Every batch carries its expiry. Sales always draw from the nearest-expiry batch first, so old stock leaves before new. The dashboard counts what expires within 90 days, per branch, before it becomes a write-off.
The drawer never balances	Expected cash is computed from the opening float, cash sales, cash expenses, debtor repayments and supplier payments — so a discrepancy means something real, not an arithmetic gap.
Credit given and forgotten	Every customer has a credit limit, zero by default. A cashier cannot quietly extend credit; a manager must set the limit or authorise the override, with a reason kept forever.
Change you could not give	Recorded against the customer's name with a 7-digit claim code, so it is a debt the shop owes — not something that lives in a cashier's memory. See chapter 9.
Cash bought things nobody recorded properly	A purchase funded partly from the drawer and partly from the safe is recorded as exactly that, so neither pot is misstated and neither comes up short at close of day.
Nobody knows who did what	Every sale, void, price change, stock write-off, transfer and safe movement names the person and the time. Voids and write-offs require a written reason.

Built for how Nigerian shops actually work

- **It keeps working when the network does not.** Sales made offline are queued on the device and sent when the connection returns. A cashier is never stopped by MTN.
- **It runs on the phone in your pocket.** Every screen works from 320px upward — the narrowest phone still in daily use — as well as on a tablet or a laptop.
- **It understands PPMV and pharmacy licensing.** Each branch records its PCN or PPMV licence and its expiry, and the dashboard warns you before renewal is due.
- **It knows about controlled drugs.** Prescription-only and controlled items refuse to sell without the prescriber or buyer details a PCN inspector will ask for.
- **Withholding tax is handled properly** — both the tax you deduct from a landlord or consultant, and the tax a hospital customer deducts from you.

2. Getting in

Everybody signs in the same way: a username and a PIN. There is no email, no password reset email, and nothing to remember beyond four digits — because the person signing in is often standing at a counter with a queue in front of them.

SCREEN 1

The sign-in screen on a laptop

On a computer

The same screen on a phone

This is the only way into PharmaRidge, and it is the same for everybody from the proprietor to the newest cashier: a **username** and a **PIN**.

There is no email address, no password-reset link and nothing to remember beyond four digits. That is deliberate — the person signing in is often standing at a counter with a queue in front of them, on a phone, possibly with no data connection.

The demonstration accounts are listed underneath the form. **Change every one of those PINs before the pharmacy opens for real trade**; PharmaRidge will keep warning you on the Users screen until you do.

The same screen on a phone — nothing is hidden or shrunk away

The same screen on a phone. Nothing has been removed or hidden behind a menu — the form is simply narrower.

Every screen in PharmaRidge works down to a 320-pixel-wide phone, which is the narrowest device still in daily use in Nigerian shops. If a control exists on the laptop, it exists here too.

Change the PINs before you open. A new installation ships with demonstration accounts on PIN 1234. PharmaRidge shows a red warning on the Users screen listing every account still using it. Use **Edit** → **Reset PIN** on each person before the pharmacy goes live.

What happens after you sign in

PharmaRidge shows you the screen that matches your job. A cashier lands on the Point of Sale. A manager or owner lands on the dashboard. The menu on the left only ever lists what your role is allowed to open — you will not find a screen that refuses you when you tap it.

3. The Owner

You own the pharmacy. You see everything, in every branch, and there are things only you can change.

SCREEN 3

The Owner dashboard: takings, stock value, expiring batches, debtors, creditors, licence renewals and attendance — for every branch at once

On a computer

The proprietor's view of the whole business, every branch at once.

- **Sales today** and the transaction count — an unusually quiet counter is visible immediately.
- **Stock value at cost** and **at retail** — the gap between them is the profit sitting on your shelves.
- **Expiring within 90 days** — the money you are about to lose if nobody acts on it.
- **Owed by customers** and **owed to suppliers**, kept separate and never netted against each other.
- **Change we owe customers** — cash in your till that belongs to somebody else.
- **Licence renewals due** — PCN and superintendent registration, before they lapse.

Use the branch selector at the top to drill into a single shop, or leave it on *All Branches* for the consolidated picture.

What the dashboard is telling you

- **Sales today** and the number of transactions, so an unusually quiet counter is visible immediately.
- **Stock value at cost and at retail** — the difference is the profit sitting on your shelves.
- **Expiring within 90 days** — the money you are about to lose if nobody acts.
- **Owed by customers** and **owed to suppliers** — both directions, never netted.
- **Change we owe customers** — cash sitting in your till that belongs to somebody else.
- **Licence renewals due** — PCN and superintendent registration, before they lapse.

Things only the Owner can do

These are deliberately locked to you. A manager cannot do them, and cannot give themselves permission to.

- **Turn VAT on or off, and set the rate.**
- **Edit the withholding-tax rates.** The 2024 schedule ships correct, but the rates are yours to adjust if the law changes.
- **Decide what managers may do** — void sales, approve expenses, change prices — each an independent switch.
- **Decide what cashiers may do** — whether they can void their own sale, within how many minutes, and how much stock they may write off without a manager.
- **Write off change the shop owes** a customer who never came back.

My Plan: your subscription, how many branches and staff you are using, and the switches that belong to you

On a computer

The same screen on a phone

What you are paying for, and what you are actually using.

The two bars show branches and staff against your contracted limits. **You are only billed for what is live:** close a shop and its slot frees the same day, retire a member of staff and their seat frees immediately. PharmaRidge's own support account is never counted.

Further down this screen are the switches that belong to you alone — VAT, withholding-tax rates, and what managers and cashiers are permitted to do without asking you.

Your books, kept as you trade

Every sale, delivery, expense, write-off and payment posts a double entry as it happens. There is no month-end bookkeeping exercise: the trial balance, profit and loss, and balance sheet are correct at every moment.

Accounting: trial balance, profit and loss, balance sheet and the withholding-tax register

Your books, kept as you trade rather than written up at month end.

Every sale, delivery, expense, write-off, transfer and payment posts a balanced double entry the moment it happens. The trial balance, profit and loss and balance sheet on this screen are therefore correct at every moment — there is no closing exercise to run and nothing to reconcile by hand.

The withholding-tax register is here too, in both directions: tax you have deducted from a landlord or consultant and owe the authority, and tax a hospital customer has deducted from you and which you can reclaim.

People

Hire, promote, move and retire staff from one screen. When somebody changes branch or role, use **Transfer & Promote** rather than creating a second account — one person keeps one account, and their history stays attached to the branch where it happened.

SCREEN 6

Users & Branches: everyone who can sign in, their role, their branch and their status

Everyone who can sign in, what they are allowed to do, and which branch they belong to.

The red banner at the top lists any account still using the demonstration PIN. It will not go away until every one has been changed, because an account on a default PIN is an account anybody can use.

Roles in one line: an **Owner** sees everything and controls tax and permissions. A **General Manager** runs every branch. A **Branch Manager** runs exactly one. **Staff** serve customers at one branch.

Transfer & Promote: a move is recorded with a reason and a date, never by inventing a second account

On a computer

When somebody changes branch or is promoted, use **Transfer & Promote** — never create a second account for the same person.

PharmaRidge asks for a reason and records the date, so the change is auditable. The person keeps **one account**, which matters more than it sounds: attendance and payroll are grouped by person, so a second account would count one employee as two and split their sales history in half.

Their past sales, shifts and tills stay attached to the branch where they actually happened. The transfer record is what shows when the change took effect.

Why one account matters. If you create a second account for the same person, attendance and payroll count them as two employees, and their sales history splits in half. PharmaRidge refuses the shortcut and gives you the correct tool instead.

Money owed to you

SCREEN 8

Debtors, and how old each debt is — a balance owed since last week is trading; the same figure owed since March is not

On a computer

The same screen on a phone

Who owes you money, and — more importantly — **how long they have owed it.**

The four buckets at the top split the total by age: 0–30 days, 31–60, 61–90, and over 90. A balance owed since last week is ordinary trading. The same figure owed since March usually is not, and it is the second one that quietly becomes a bad debt.

Every customer has a credit limit, and it is **zero by default** — new customers are cash-only until somebody with authority decides otherwise.

Money going out

SCREEN 9

Expenses, showing which pot paid: the till drawer, the branch safe, or the bank

On a computer

Every cost the pharmacy has recorded, and — in the *Paid via* column — **which pot of money paid for it**: the till drawer, the branch safe, or the bank.

That column matters because the two cash pots reconcile separately. A payment recorded against the wrong one will show up later as a discrepancy in a drawer that was actually counted correctly, and you will spend an evening looking for money that was never missing.

A single expense can be **split across two pots** — part drawer, part safe — which is what actually happens when a delivery costs more than the till holds. Each part is charged where it came from, so both reconciliations stay true.

Recording an expense is deliberately open to cashiers: the person sent out for diesel is usually the person at the counter. What a cashier cannot do is *browse* the pharmacy's other costs — the rent, the salaries, what another branch spends. Writing a cost down and reading everyone else's are two different powers.

Where a supplier or landlord requires withholding tax, enter the rate and PharmaRidge records the net paid and the tax withheld separately, so the WHT register is built as you trade rather than reconstructed at year end.

The screen at night

SCREEN 10

Dark mode — for a dim shop at 6am, or a proprietor checking takings in bed

On a computer

The same screen on a phone

The same dashboard in dark mode.

This is not decoration. A pharmacy opening at 6am, a night shift, or a proprietor checking the day's takings in bed all involve looking at a bright screen in a dark room. The toggle sits in the top bar and the choice is remembered per device, so the shop laptop and your own phone can differ.

Every colour in the application carries a meaning rather than a fixed value — money in, money out, something needs attention — and both themes answer with their own shade. That is why the dark theme is not simply an inverted screenshot: warnings stay amber and legible, positive figures stay green, and no panel ends up as white text on a white chip.

Printing always uses the light theme, whichever mode you are working in. A receipt printed from dark mode would otherwise come out as a solid block of ink — and on an 80mm thermal roll that is a wasted roll per sale before anybody notices.

The pharmacy in your pocket

Everything above works on a phone. Nothing is removed; wide tables scroll sideways with a swipe.

SCREEN 11

The Owner dashboard on a phone

The full owner dashboard on a phone — every figure, nothing removed.

Wide tables scroll sideways with a swipe rather than being cut down, so you are never shown a partial number. In practice this is how most proprietors will check on the business: from the phone in their pocket, not from a desk.

The menu slides in over the page

On a phone the menu slides in over the page when you tap the button at the top left, and slides away again as soon as you choose something or tap outside it.

It lists only the screens your role can actually open, so you will never tap something that then refuses you. A cashier's menu is genuinely short; an owner's is long and grouped — Daily Work, Stock, Money & People, Setup — because eighteen destinations in one flat list is a list nobody reads.

The screen you are on is highlighted, so after an interruption you can see where you were without guessing. Every entry carries a drawn icon rather than an emoji: many budget Android builds ship without an emoji font and would render a row of empty boxes.

4. The Co-Owner

A second proprietor is simply a second Owner account. Everything in chapter 3 applies to them exactly as it applies to you.

What is the same

- Both owners see every branch, every figure and every report.
- Both can set VAT, withholding-tax rates, and the manager and cashier permission switches.
- Both can hire, promote, transfer and retire anybody.

What changes when there are two of you

- **Every action still names the person who took it.** "The Owner voided it" is never the answer — the record says which owner, and when.
- **Either owner can recover the other.** If one owner is locked out by mistyped PINs, the other clears it instantly. With a single owner, only PharmaRidge support can.
- **Neither can remove the last one.** PharmaRidge refuses to deactivate or delete an Owner account if it is the only active one left, because a pharmacy with no Owner cannot change its own tax settings or permissions — and no manager can restore one.

Recommended. If the business has two proprietors, create both as Owner accounts on day one. It costs the same, and it removes the single most awkward support call there is.

Dividing responsibility without dividing access

Some partnerships prefer one owner on the money and the other on operations. PharmaRidge does not force that split, but it makes it visible: the withholding-tax register, the void report and the safe ledger all name the acting person, so an agreed division of labour is auditable without restricting either partner's access.

5. The General Manager

You run every shop, day to day, on the proprietor's behalf. You see what the Owner sees — except the things that belong to ownership.

SCREEN 13

A General Manager sees and runs every branch

The same screen on a phone

On a computer

A General Manager runs every shop on the proprietor's behalf, and sees what the Owner sees.

The difference is authority over the business itself rather than its operations: a General Manager cannot change VAT or withholding-tax rates, cannot alter what managers and cashiers are permitted to do, and cannot touch the subscription. Everything operational — stock, staff, pricing, transfers, cash — is theirs.

What you can do everywhere

- Open branches, hire staff, and move people between shops.
- Order stock, receive deliveries, and move stock between branches.
- Set prices, run stocktakes, and write off damaged or expired stock.
- Void a sale, approve an expense, and settle supplier accounts.
- Move money in and out of any branch's safe.

What you cannot do

- Change VAT or withholding-tax rates.

- Change what managers or cashiers are permitted to do — those switches are the Owner's.
- Write off change owed to a customer.
- Alter the subscription, the branch cap or the staff cap.

The same screen on a phone

Every batch in every branch, with its expiry date.

PharmaRidge tracks stock at **batch** level, not just product level, which is what makes two things possible: an expiry warning that is actually accurate, and traceability if a batch is ever recalled.

Sales always draw from the **nearest-expiry batch first**, automatically. Nobody at the counter has to think about it, and old stock leaves before new.

Moving stock where it sells

A slow-moving pack at one shop is often a fast seller at another. A transfer keeps the batch number and expiry date intact, so traceability survives the move, and the receiving branch must confirm arrival before the stock becomes sellable there.

The same screen on a phone

Moving stock between branches — a slow seller at one shop is very often a fast seller at another, and shifting it is cheaper than writing it off when it expires.

A transfer keeps the **batch number and expiry date** intact, so traceability survives the move. If NAFDAC recalls that batch six months later you can still find it, whichever shop it ended up in.

The receiving branch must **confirm arrival** before the stock becomes sellable there. Until they do it is in transit: gone from the sender's sellable figure, not yet in the receiver's. That is what stops the same pack being sold twice, and it is also what makes a disappearance visible — stock that never gets confirmed stays on the in-transit list with both branches named.

A partial receipt is allowed. If eight of ten cartons arrive, receive eight; the balance stays in transit and the discrepancy is on the record rather than in somebody's memory.

Buying

SCREEN 16

Purchase orders — ordered, received, and what is still outstanding

What has been ordered, what has arrived, and what is still outstanding.

Receiving a delivery is where cost price, selling price, batch number and expiry all enter the system — which is why stock cannot simply be typed in from nowhere. Everything on your shelves arrived through a delivery, and can be traced back to one.

PharmaRidge refuses to receive stock that has already expired.

People and hours

SCREEN 17

Attendance with GPS verification and computed hours for payroll

Who clocked in, where they were when they did it, and how many hours the shift came to.

If a branch uses GPS, PharmaRidge checks the person is actually at the shop. A failed check — common indoors, with a weak signal — does **not** reject the shift; it flags it for a manager to review. The hours column is computed from the two timestamps, so payroll is not somebody subtracting times by hand.

6. The Branch Manager

You run one shop. PharmaRidge shows you that shop and nothing else — not as a restriction, but so that every figure you look at is yours.

SCREEN 18

A Branch Manager sees only their own branch — the branch name is shown in the top bar instead of a branch selector

The image displays two versions of the PharmaRidge Branch Manager Dashboard. The left version is a desktop view for 'Rivertown Pharmacy - Ikeja', showing a sidebar with navigation options like 'Point of Sale', 'Sales History', 'Till / Cash', and 'Stock'. The main area features a 'Dashboard' with key metrics: Sales Today (N20,138.20), Stock Value (Cost) (N252,115.00), Stock Value (Retail) (N428,595.50), and Expiring items (4 batch(es)). It also includes a 'Sales Trend' table for the last 14 days and a 'Per-Branch Breakdown' table for today's sales across different branches.

The right version is a mobile view of the same dashboard, showing a simplified layout with the same key metrics and a 'Logout' button in the top right corner.

On a computer

A Branch Manager sees one shop: their own.

Notice the top bar — where an Owner has a branch selector, a Branch Manager has their branch **name**. That is not a restriction so much as a guarantee: every figure on every screen they open is theirs, with no possibility of reading another branch's numbers by mistake.

What you control at your branch

- Open and close the till, and force-close a cashier's till if they left without doing it.
- Set prices at your branch, run stocktakes, and write off damaged stock.
- Void a sale with a reason, and approve expenses.
- Set customer credit limits and authorise an override.
- Move money in and out of **your** branch's safe.
- Review attendance, and correct a clock-in that failed the GPS check.

What you cannot do

- See or touch another branch — including its safe, its stock and its staff.
- Open a new branch, or change anyone's role to Owner.
- Change VAT, withholding-tax rates, or the permission switches.

The two pots of cash

Your shop holds money in two places, and PharmaRidge treats them as genuinely different things.

The same screen on a phone

On a computer

The two pots of cash at a shop, on one screen, because they are genuinely different things.

The **till drawer** at the top is the counter cash box. It is counted and reconciled at the end of every shift, and it is the only pot a cashier handles all day.

The **branch safe** below is the shop's reserve. It is not part of the till count, no sale ever touches it, and it is what pays for a delivery or the rent that the drawer could never cover.

Money moves between them explicitly and never by accident.

PharmaRidge — Onboarding Guide

24

Recording money into the safe: what, how much, and why

On a computer

Recording money into the safe: how much, and **why**.

The reason is required, not optional. It is the only record anyone will have in six weeks' time of why cash moved, and every movement also names the person who recorded it.

The four movement types cover what actually happens in a shop: a deposit into the safe, a withdrawal out of it, a sweep of the drawer into the safe at close of day, and topping the drawer back up for change.

Counting the shelves — a stocktake at your own branch

On a computer

Counting the shelves against what the system believes you have.

PharmaRidge **records the variance** rather than silently overwriting the figure, so a shortfall is visible as a shortfall — which is the entire point of counting. Software that quietly adopts your count destroys the only evidence that anything went missing.

Only one stocktake can be open at a branch at a time, so two people cannot count the same shelves against each other and commit contradictory numbers.

Counting **zero** is a valid, meaningful result — it is how an empty shelf is recorded — and it is treated differently from not having counted an item at all.

Variances on **controlled drugs** are held to a higher standard: the write-off needs a manager, and the entry lands in the controlled register where an inspector will look for it. A counting session that would quietly write off a controlled substance is refused.

Count during quiet hours where you can. Stock keeps moving while you count, and the variance is measured against the batch's quantity *at the moment you record it*, not against a figure frozen when the session opened.

What your cashiers may spend

Your cashiers can buy things for the shop out of the drawer, the safe, or both. How much they may take **from the safe** in one purchase is yours to set — and you can set it to no limit at all by entering **0**. Anything above the limit comes to you.

The cashiers’ safe allowance — the one plan setting a manager controls

On a computer

The one plan setting a manager controls: **how much your cashiers may take from the safe for a single purchase.**

Set a figure and anything larger comes to you. Set it to **0 and there is no limit.** Untick the box entirely and cashiers cannot touch the safe at all, though they can still spend from the till drawer.

Everything else on the Owner's plan screen — VAT, withholding-tax rates, and what *managers* may do — stays with the Owner. A manager who could widen their own authority would not really be restricted at all.

This is the only setting on that screen a manager can change. VAT, withholding-tax rates and what *managers* may do all belong to the Owner — a manager who could widen their own authority would not really be restricted at all.

Your staff

SCREEN 23

Only your own branch's staff appear

A Branch Manager's staff list contains their own branch and nobody else. This is not a filter they can clear — the other branches' people are not sent to their device at all.

They can hire, review attendance for, reset the PIN of, and deactivate their own people. They cannot see another branch's staff, cannot move somebody between branches, and cannot create an Owner or promote anyone to one.

The distinction that matters here is between a **Branch Manager** and a **General Manager**. Both are the same role; what separates them is whether the account is pinned to a branch. Pin it and they see one shop. Leave it unpinned and they see the whole estate. You change one from the other by transferring the account, which keeps their history intact rather than creating a second login for the same person.

A locked-out manager is unlocked by anyone ranked above them, immediately, without contacting support.

7. Counter Staff

You sell, you take money, you clock in and out. PharmaRidge is designed so that the busiest person in the shop has the fewest steps.

SCREEN 24

The Point of Sale, waiting for the next customer

On a computer

The same screen on a phone

The Point of Sale, waiting for the next customer. This is where a cashier spends almost the entire day.

The layout is deliberately plain: find the product on the left, the cart builds on the right, take the money at the bottom. There is no navigation to learn between customers.

If the network drops mid-shift, keep selling. Sales are stored on the device and sent automatically when the signal returns.

Making a sale

1. **Find the product.** Type any part of the name — brand or generic.
2. **Add it.** PharmaRidge picks the nearest-expiry batch automatically, so old stock always leaves first. You do not have to think about batches.
3. **Choose the unit** — single, pack or carton — and the price follows.
4. **Take the money.** Cash, POS card, transfer, or credit. You can split one sale across more than one method.
5. **Complete the sale** and hand over the receipt.

Searching by name — brand or generic both work

On a computer

Type any part of the name — brand or generic. PharmaRidge searches both, so "paracetamol" finds Panadol and vice versa.

Adding an item picks the correct batch for you: the one expiring soonest. You choose the unit — a single, a pack, or a carton — and the price follows automatically.

Prescription-only and controlled medicines will stop and ask for the prescriber or buyer details a PCN inspector expects to see. That is the system protecting the pharmacy's licence, not obstructing the sale.

When there is no change to give

The customer's goods come to N400. They hand you N500. There is no N100 note in the drawer. Type **100** into **Change Owed**, and put the customer's name or phone number in the box that appears. PharmaRidge does the rest: the money stays in the till where it belongs, the customer gets a **7-digit claim code** printed on their receipt, and the shop now formally owes them N100.

SCREEN 26

Recording change the shop could not give — a name or a phone number is enough

On a computer

The commonest event behind a Nigerian counter: the goods come to N400, the customer hands over N500, and there is no N100 note in the drawer.

Type **100** into *Change Owed* and put the customer's name or phone number in the box that appears — either one is enough. The money stays in the till where it belongs, the customer gets a **7-digit claim code** printed on their receipt, and the shop now formally owes them N100.

This protects **you**. Before, that N100 sat in your drawer with no record, and at close of day your till read N100 over — looking like your discrepancy. Now the drawer balances exactly.

Why this matters to you. Before, that N100 sat in your drawer with no record. At close of day your till showed N100 more than the system expected, and it looked like *your* discrepancy. Now the drawer balances exactly, and the customer's claim is the shop's problem, not your memory.

Buying something for the shop

When you are sent to buy diesel, pay the okada, or collect a carton from the depot, record it on the **Expenses** screen. You choose where the money came from:

- **Cash** — out of the till drawer in front of you.
- **Safe** — out of the shop's cash reserve.
- **Both** — whatever was in the drawer, and the rest from the safe.

For a combination, type only what came out of the **drawer**. PharmaRidge works out the rest and shows it to you before you save, so you never have to do the subtraction.

SCREEN 27

On a computer

The same screen on a phone

Buying something for the shop that the till drawer alone cannot cover.

Choose **Both**, and type only what came out of the **drawer**. PharmaRidge works out the rest and shows it to you before you save — here, N8,000 from the drawer and the remaining N12,000 from the safe.

Each pot is then reduced by exactly its own share. Before this existed, a purchase like this had to be recorded as though it all came from one place, whichever you chose was wrong, and one of the two came up short at close of day.

The safe has a limit your manager sets; the drawer is limited only by what is actually in it.

Why this matters. Before, a purchase like this had to be recorded as if it all came from one place. Whichever you picked was wrong, and at close of day one of the two came up short — usually looking like *your* mistake. Now each pot is reduced by exactly what left it.

There is a limit on the safe, and your manager sets it. You can take up to whatever your manager or the Owner has allowed for one purchase — anything larger needs them. The till drawer is limited only by what is actually in it: PharmaRidge will not let you record more cash leaving the drawer than the drawer holds.

You can record what you spent, but you cannot browse the pharmacy's other costs — the rent, the salaries, what other branches spend. Your manager sees the full report.

Your till

Open the till with the float you were given. Sell all day. At close, count the drawer and type what you counted — PharmaRidge shows you what it expected, so you can find a mistake before you commit the count, not after.

Opening, watching, and closing the drawer

Open the till at the start of your shift with the float you were given. Sell all day. At the end, count the drawer and type what you counted.

PharmaRidge shows you the figure it **expected** before you commit, so if there is a difference you can look for it while the shift is still fresh, rather than discovering it afterwards.

That expected figure accounts for everything real: cash sales, cash you took for a debt repayment, cash spent on a purchase, and change you kept because you had no note to give.

Closing your shift — the order to do it in

1. **Finish every sale.** Nothing half-rung. If a sale is waiting on a prescription detail, complete it or cancel it.
2. **Record anything you spent** out of the drawer — transport, diesel, a delivery paid at the door. If it is not recorded, it will show up as a shortage and look like missing money.
3. **Deposit large notes to the safe** if that is your shop's rule, before you count.
4. **Count the drawer physically.** Count it twice if the figures are large.
5. **Type what you actually counted** — not what you think it should be. The system already knows what it expects; typing the expected figure defeats the entire check.
6. **Look at the difference** before you commit. A small shortage is usually an unrecorded expense or change given from the wrong pot, and it is far easier to find now than tomorrow.
7. **Clock out.**

If you are short, say so and close anyway. A recorded shortage with an honest explanation is a normal event that your manager can investigate. A drawer left open overnight, or a count typed to match, is what turns a small discrepancy into a real problem.

What you may and may not do

- **You may void your own mistake** — your own sale, within the window the Owner set (15 minutes by default), while the till is still open, and with a reason. A mis-keyed sale at a busy counter should not need a phone call.
- **You may not void somebody else's sale.** That is not correcting a mistake, it is reversing another person's takings.
- **You may write off a small quantity** of damaged stock — up to the limit the Owner set (5 units by default). Anything larger needs a manager.
- **You may not see what the pharmacy owes its suppliers**, open the accounts, or change anyone's access.
- **You may buy things for the shop** from the drawer, the safe, or both — the safe up to the allowance your manager set. You cannot browse the pharmacy's other costs.
- **You may not deposit into or withdraw from the safe directly.** Spending it on a recorded purchase is allowed within your allowance; moving the money itself is a manager's job.

The same screen on a phone

On a computer

Everything sold today, and who served each sale.

You can void **your own** mistake — your own sale, within the window the Owner set (15 minutes by default), while the till is still open, and with a reason. A mis-keyed sale at a busy counter should not need a phone call.

You cannot void somebody else's sale. That is not correcting a mistake; it is reversing another person's takings, and it needs a manager.

Clocking in

Clock in when you arrive and out when you leave. If your branch uses GPS, PharmaRidge checks you are actually at the shop; if the check fails — a weak signal indoors is common — the shift is flagged for your manager to review rather than silently rejected.

SCREEN 30

Clock in, clock out, and the hours that feed payroll

On a computer

The same screen on a phone

Clock in when you arrive and out when you leave. The hours computed here are what feed payroll.

If your branch uses GPS, PharmaRidge checks you are at the shop. If the check fails — a weak signal indoors is common — your shift is **flagged for your manager to review**, not rejected. You will not lose a day's pay to a bad signal.

Working from a phone

The full Point of Sale runs on a phone. If the network drops, keep selling — sales are stored on the device and sent automatically when the signal returns.

SCREEN 31

Selling from a phone

The full Point of Sale on a phone. Every function is here: search, cart, unit selection, discount, split payment and change owed — nothing is withheld from the small screen.

This matters for a shop with one counter and two people serving, or a cashier covering the front while the laptop is in the office. It is also the answer for a branch that cannot justify a computer: the phone in the assistant's pocket is the terminal.

The cart is laid out for thumbs: large tap targets, quantity steppers rather than a keyboard, and the total pinned where it stays visible while you scroll the basket. Prescription and controlled medicines interrupt in exactly the same way they do on a laptop, so nothing about the licence protection is weakened by working on a phone.

It works down to a 320-pixel screen — the narrowest phone still in everyday use in Nigeria — and every screen in this guide has been tested at that width.

The till on a phone

Opening and closing the drawer from a phone works exactly as it does on a laptop, including the expected-cash figure shown before you commit your count.

This is what makes PharmaRidge usable in a shop that has no computer at the counter at all. A N25,000 Android phone is enough to run a whole branch: open the till in the morning, sell all day, record what you spend, and close the drawer at night.

One till is open per branch at a time, not per person. If two of you serve from the same drawer you share the same session, and whoever closes it counts the whole drawer — which is correct, because there is only one drawer to count.

If your phone loses signal mid-shift the sales keep working and queue on the device; the till figures catch up when the connection returns. You do not have to stop serving.

8. The branch safe

A pharmacy does not pay its rent out of the counter drawer. PharmaRidge models the shop's cash reserve as a separate pot, because that is what it is.

	The till drawer	The branch safe
What it is	The counter cash box	The shop's cash reserve
Counted	At every till close	Not part of the till count
Who touches it	Cashiers, all day	Managers and the Owner only
Typically pays for	Small running costs, change	Deliveries, rent, salaries

Why it exists

PharmaRidge will not let you record a N50,000 cash expense against a drawer holding N25,000, because that produces a cash figure no shop can physically have, and it makes every later count meaningless. But the payment is real — it came from the safe. Record it as **Safe**, and the books follow the money correctly.

Who can move it

What they can do	Owner	General Mgr	Branch Mgr	Staff
Move any branch's safe (deposit / withdraw)	Yes	Yes	No	No
Move their OWN branch's safe	Yes	Yes	Yes	No
See the safe balance	Yes	Yes	Yes	Yes
Pay an expense from the safe	Yes	Yes	Own branch	Up to their allowance
Pay a supplier from the safe	Yes	Yes	Own branch	Up to their allowance
Pay from the drawer AND the safe together	Yes	Yes	Own branch	Up to their allowance
Set the cashiers' safe allowance	Yes	Yes	Yes	No

Paying from both pots at once

A purchase is often funded from whatever was in the drawer plus the rest from the safe. Record it as **Both**, say how much came from the drawer, and PharmaRidge takes the remainder from the safe. Each pot is reduced by exactly its own share, and each is checked separately: the drawer must physically hold its part, and the safe must hold its part.

What a cashier may take

Cashiers can spend from the safe up to a limit set by **the Owner or any manager**. Setting the limit to **0 means no limit**; unticking the box stops safe spending by cashiers entirely, while still leaving them free to spend from the drawer.

PharmaRidge support cannot move your cash. The vendor's own support account can read your settings and help you recover a locked-out owner, but it is refused outright from every safe movement. Your money is moved by your people only.

Every movement records who, how much, when and **why** — the reason is required, not optional. The balance is always the sum of that history, so it cannot drift.

The five cash movements, and what each one is for

Movement	When you use it
Deposit to safe	Taking a large amount out of the drawer during the day so it is not sitting in an open till. The commonest movement in a busy shop.
Withdraw from safe	Money leaving the shop — banking it, or the owner collecting takings.
Transfer to till	Refilling the drawer: small notes for change, or funding a purchase the cashier is about to make.
Spend from safe	Paying for something directly out of the safe — a supplier delivery, diesel, a repair — without the money passing through the drawer.
Split payment	A purchase too big for the drawer alone: part drawer, part safe. Each part is charged to the right pot, so neither reconciliation is thrown out.

If the drawer does not balance

A shortage or an overage is recorded, not hidden. PharmaRidge posts the difference to a **cash over/short** account and closes the shift honestly, so the books always agree with the cash that is physically there. What you get is a running record of which shifts and which people are consistently out — which is the information that actually fixes the problem.

A cash purchase larger than the drawer holds is **refused**, and the message tells you what the drawer has and suggests taking the balance from the safe. That refusal is deliberate: allowing it would leave the till showing negative expected cash and impossible to close.

9. When you have no change

The most ordinary event behind a Nigerian counter, and the one most software has no answer for.

SCREEN 33

Every claim the shop still owes, with its code, the customer, what they bought, and when

On a computer

The same screen on a phone

Everything the shop currently owes customers in change, with the claim code, the customer, what they bought and when.

Any cashier can open this and pay a claim out — deliberately, because the person who meets the returning customer is whoever is on duty, not necessarily whoever took the original sale. Requiring a manager would guarantee the money gets paid from the drawer with nobody writing it down.

A claim can only be settled **once**. If a colleague already paid it, PharmaRidge refuses and tells you when and by whom.

How it works, end to end

- At the counter.** The cashier types the amount owed and the customer's name or phone.
- On the receipt.** The customer walks out with a 7-digit claim code printed on their receipt, next to the amount.
- In the till.** The money stays in the drawer — and the drawer still balances, because PharmaRidge knows the cash is there and knows it is not the shop's.
- In the books.** It is recorded as a liability, not as income. Your profit figure is not flattered by money you owe somebody.

5. **When they come back.** Any cashier can find the claim and pay it out — no manager needed, because the person who meets the returning customer is whoever is on duty.

31-60

N0.00

On a computer

The same screen on a phone

The customer has come back but lost the slip with their code. Search by their **name** or their **phone number** instead — partial matches work.

This is why the cashier is asked for a name or number at the counter in the first place. The 7-digit code is the fast path, never the only one, because a lost receipt must not mean lost money.

Three ways to find a claim

- **The 7-digit code** — fastest, if they kept the receipt.
- **Their name** — partial matches work.
- **Their phone number** — partial matches work.

Settling it

- **Pay it out in cash** when they return.
- **Apply it to a new purchase** — they buy something today and the change covers part of it.
- **Write it off** — Owner only, with a reason. Unclaimed change never expires on its own and never quietly becomes the shop's money.

A claim can only be settled once. If a colleague already paid it, PharmaRidge refuses and tells you when and by whom — so nobody is paid twice for the same N100.

The questions owners ask about this

Question	Answer
Does unclaimed change expire?	Never on its own. It stays on your books as money you owe until the customer collects it or you write it off deliberately. Nothing in the system quietly converts it into profit.
What if the customer loses the slip?	Their name or phone number finds the claim. The seven-digit code is a convenience for speed at the counter, not a condition of being paid.
Can a cashier pay a claim?	Yes — settling a claim is ordinary counter work. What a cashier cannot do is <i>write one off</i> ; that is the Owner's decision and it is recorded with a reason.
Where does it show in the accounts?	As a liability, not as income. Your profit figure is never inflated by money you are still holding for somebody else. A write-off later appears as other income, kept out of Sales Revenue so your trading margin stays honest.
What happens if the sale is voided?	An outstanding claim is cancelled with the sale — the shop cannot owe change on a sale that no longer exists. A claim the customer has <i>already collected</i> stays on record, because that money genuinely left the drawer.
Does the till still balance?	Yes. The cash you kept is still in the drawer and the system knows it is spoken for, so your expected cash at close-of-day already accounts for it.

10. Who can do what

The complete picture. "Own branch" means the rule applies only at the branch that person is assigned to.

Selling and the till

What they can do	Owner	General Mgr	Branch Mgr	Staff
Make a sale	Yes	Yes	Yes	Yes
Open / close a till	Yes	Yes	Yes	Yes
Force-close somebody else's till (with a reason)	Yes	Yes	Own branch	No
Void own sale within the window	Yes	Yes	Yes	Yes*
Void anybody's sale, any time	Yes	Yes*	Yes*	No
Record change owed to a customer	Yes	Yes	Yes	Yes
Pay out change owed	Yes	Yes	Yes	Yes
Write off unclaimed change	Yes	No	No	No

Stock

What they can do	Owner	General Mgr	Branch Mgr	Staff
See stock and expiry	Yes	Yes	Own branch	Own branch
Order stock / receive a delivery	Yes	Yes	Own branch	No
Transfer stock between branches	Yes	Yes	Own branch	No
Change a price	Yes	Yes*	Yes*	No
Write off damaged stock (small amount)	Yes	Yes	Yes	Yes*
Write off any amount	Yes	Yes	Own branch	No
Run a stocktake	Yes	Yes	Own branch	Yes

Money

What they can do	Owner	General Mgr	Branch Mgr	Staff
Record an expense / purchase	Yes	Yes	Own branch	Own branch
See every expense the pharmacy has recorded	Yes	Yes	Own branch	No
Pay from the till drawer	Yes	Yes	Own branch	Own branch
Pay from the branch safe	Yes	Yes	Own branch	Up to allowance
Pay from BOTH at once	Yes	Yes	Own branch	Up to allowance
Set the cashiers' safe allowance (0 = no limit)	Yes	Yes	Yes	No
Approve an expense	Yes	Yes*	Yes*	No
See what is owed to suppliers	Yes	Yes	Own branch	No
Pay a supplier	Yes	Yes	Own branch	No
Set a customer credit limit	Yes	Yes	Own branch	No
Authorise a credit-limit override	Yes	Yes	Own branch	No
Move the branch safe	Yes	Yes	Own branch	No
Open the accounts / general ledger	Yes	Yes	Yes	No

* Subject to a switch the Owner controls. The Owner can turn off manager voids, manager expense approval and manager price changes independently; and can set whether cashiers may void at all, within how many minutes, and how much stock they may write off.

People and settings

What they can do	Owner	General Mgr	Branch Mgr	Staff
Hire a member of staff	Yes	Yes	Own branch	No
Promote / transfer somebody	Yes	Yes	No	No
Deactivate an account	Yes	Yes	Own branch	No
Create an Owner account	Yes	No	No	No
Open a new branch	Yes	Yes	No	No
Close / relocate a branch	Yes	Yes	No	No
Review flagged attendance	Yes	Yes	Own branch	No
Turn VAT on / set the rate	Yes	No	No	No
Edit withholding-tax rates	Yes	No	No	No
Set what managers may do	Yes	No	No	No
Set what cashiers may do	Yes	No	No	No

The rules that protect you from yourself

- **The last Owner cannot be removed.** Not deactivated, not deleted, not demoted — because no manager could restore one.
- **Nobody can act above their own level.** A manager cannot edit an Owner's account, and a cashier cannot edit anybody's.
- **A closed branch keeps its history** and stops consuming a paid slot. You can reopen it at a new address, carrying the history over or starting fresh — your choice, asked explicitly.
- **Deactivating somebody closes their open shift** automatically, so a departed employee is never left permanently clocked in.

The vendor's own account

PharmaRidge support has an account for helping you: it can see your plan, adjust your branch and staff limits, and recover a locked-out owner. It **cannot** move your safe, and it is excluded from the staff count you pay for.

The support portal — clearly labelled as someone else’s account, so a support engineer is never in doubt whose settings they are changing

On a computer

PharmaRidge support's own view of your account, shown here for completeness.

Support can see your plan, adjust your branch and staff limits, and recover an owner who has locked themselves out. Support **cannot** move money in or out of your safe — that is refused outright — and the support seat is never counted against the staff you pay for.

The screen is clearly labelled as somebody else's account so a support engineer is never in any doubt whose settings they are changing.

Taking a delivery from your supplier

Your supplier does not sell you tablets. They sell you **cartons**, and they send one invoice for the lot. PharmaRidge records a delivery the way it actually arrives, and works out the rest itself.

Why this matters more than it sounds

Most stock systems make the storekeeper do the arithmetic at the delivery door: ten cartons, ten packs to a carton, ten tablets to a pack — type 1,000. It works until somebody is counting a delivery in the rain with a driver waiting, and then it is 100, or 10,000, and nobody notices for a month. Every figure the shop reports afterwards — stock value, margin, reorder level — is built on that one number.

So the system asks the question the way the delivery note is written, and does the multiplication.

The four things it asks

What it asks	Why
Arrived as — cartons, packs or pieces	Pick whichever matches the delivery note. Choosing <i>cartons</i> then asks how many packs are in a carton and how many pieces are in a pack; choosing <i>packs</i> asks only for the pieces; choosing <i>pieces</i> asks nothing further. You are never shown a box that does not apply.
How many	Ten cartons is ten. The conversion to pieces is shown live, in words, before you save: “10 cartons × 10 packs × 12 pieces = 1,200 pieces onto the shelf”. If that sentence is wrong, the delivery note and the form disagree — and you find out now rather than at stocktake.
Total paid for this line	The figure on the invoice. PharmaRidge divides it: cost per carton, per pack and per piece, all shown before you commit. Nobody has to work out what one tablet cost.
Sold over the counter as	How the counter will sell it — and it does not have to match how it arrived. Buying by the carton and selling by the tablet is the whole pharmacy business. The selling <i>price</i> can be left blank now and set later on the Stock screen.

Every delivery still carries its batch number and expiry date. Those are per LINE, not per delivery, so one goods-received entry can hold six cartons expiring in 2027 and four expiring in 2028 as two separate batches. That is deliberate: they must stay separate for the shop to sell the nearer expiry first and for a recall to find the right stock. Add a line for each batch that arrived.

What the system does with it

- **Converts to pieces** and puts that on the shelf, because a sale can be a single tablet and the shelf count has to be able to express one.
- **Remembers the nesting as delivered**, on that batch. The same drug arrives 10×10 from one supplier and 24×1 from another; recording it per delivery is what makes “a carton” mean the right number for the stock you actually hold.
- **Splits the invoice total** into per-piece, per-pack and per-carton cost, keeping full precision so the stock value always reconciles back to what you actually paid, to the kobo — even when the division is not exact.
- **Refuses what cannot be true.** A carton delivery with no carton size, half a carton, a carton of 99,999,999 packs, or selling by the carton something that arrived loose — each is refused with a plain sentence saying which line and what is missing.

Receiving part of an order

If only some of the order arrives, receive what came. The order stays open at **PARTIALLY RECEIVED** and the balance can be recorded whenever the rest turns up, on its own batch numbers and its own invoice figure. You are never forced to pretend a delivery was complete to close the paperwork.

When the network drops — and why that is the point

Nigerian pharmacies do not have reliable connectivity, and software that assumes otherwise stops the counter. PharmaRidge is built the other way round: **the shop keeps trading, and the system catches up.**

Why PharmaRidge does this and most systems do not

Cloud pharmacy systems put the database somewhere else and talk to it on every keystroke. When the line drops, the till stops. The usual workaround is a paper notebook and re-keying in the evening — which is where the errors, the missing sales and the arguments come from.

PharmaRidge keeps a full working copy *on the device*. A sale rung up with no signal is a real sale: it prints, it takes payment, it comes off the shelf count. When the connection returns it is sent up and merged. Nobody re-types anything.

That design creates one hard problem, and it is the problem most offline-capable software gets wrong: **what happens when work done offline arrives after the world has changed?** Two answers in this product exist purely for that, and both were found by testing the collision rather than the happy path.

A transfer that corrects itself

Your manager sends a whole batch of Amoxil from Ikeja to Surulere. Meanwhile a cashier at *Ikeja*, working with no signal, sells three of them over the counter. That sale is legitimate — the stock was physically there and a customer walked out with it — but it only reaches the server after the transfer was raised.

Naive software refuses the delivery: the sending branch no longer has what the paperwork says. The stock is then stranded, belonging to neither shop, until somebody notices and unpicks it by hand. **PharmaRidge corrects the transfer instead.** It moves what is actually on the shelf, records that three units went to a sale, and completes:

What the record shows	Why it is kept
Quantity sent: 156	What the manager intended. Never rewritten, so the original instruction is always readable.
Quantity received: 153	What actually moved, and exactly what the destination shelf now holds.
Shortfall: 3	The difference, with a plain-English note. Sent = received + shortfall, always — nothing is invented and nothing quietly disappears.

The shortfall is **flagged, not silent**. An offline sale is the ordinary explanation, but a miscount or a theft produces exactly the same arithmetic, so a manager sees the difference and can ask. If the batch was sold out entirely before the transfer arrived, the transfer is cancelled automatically with the reason recorded — rather than sitting in a queue forever.

Nobody is moved out from under their own work

The same hazard applies to people. A cashier working offline at Ikeja is reassigned to Surulere mid-shift. Their queued sales, their open till and their clock-in all belong to a branch they are no longer attached to, and they find out when the device reconnects and the work is refused.

So a staff transfer now works like a stock transfer: **it is proposed, and the person confirms it.**

- The manager raises the transfer with a reason, as before.
- **Nothing changes yet.** The person keeps working exactly where they are, so anything they record offline stays valid.
- They see the request the next time they sign in, with where they are going and who asked.
- They confirm once they have closed their till and finished at the old counter — and only then do they actually move.
- If they cannot move yet they say so, with a reason their manager can read.

And it can never become a new way to get stuck. Somebody who has resigned, lost their phone or simply will not answer would otherwise leave a transfer unresolved forever. An **Owner or General Manager can force it through** — recorded as forced, so “they agreed” and “it was imposed” are never confused in the history. A Branch Manager cannot.

What this is worth to you

Both of these are invisible when everything works. Their value shows on the bad day: the day the network is out for four hours, the day a delivery and a busy counter collide, the day you move someone at short notice. On those days the shop keeps trading and the books still add up — which is the entire promise of an offline-first system, and the part most of them do not finish.

What the system prints and exports

Every sample on the next few pages is a photograph of real output from this system — not a drawing of one. They are produced by the same code that runs when your cashier presses **Print**, so what you see here is what your printer will produce.

A pharmacy hands over or files four kinds of document, and PharmaRidge produces all four from the same records, so they can never disagree with one another:

Document	Where it comes from	What it is for
Thermal receipt	POS → Print	The 80mm roll receipt the customer walks out with. Printed at the counter in a second or two.
A4 receipt	POS → A4	The same sale on ordinary paper — for a company buyer, an HMO, or a customer who needs something to claim against.
Printed report	Any report screen → Print / PDF	Stock, sales, expenses, trial balance, P&L. Save it as a PDF from the same dialog to email or file it.
Spreadsheet (CSV)	Any report screen → CSV	The same figures for your accountant to work on in Excel or Google Sheets.

Why there is no “Download PDF” button. There is a **Print / PDF** button instead, and it does more than a download button would. Every device you will use already has a PDF writer built into its print dialog — on a laptop choose *Save as PDF* as the destination; on Android Chrome the same option is in the printer list; on an iPhone, Share → Print, then share the preview. Going through the print dialog means the PDF has **real, selectable, searchable text** that an accountant can copy a figure out of, and the identical document also goes straight to paper or to the counter’s thermal printer. A bundled PDF library would have added roughly 350 KB to what every phone in the shop must download and keep offline, and would have produced a flat image instead of text.

The thermal receipt — 80mm roll

This is the standard counter receipt, printed on the same 80mm roll every POS printer in Nigeria uses. It is deliberately plain: no logos to burn through ribbon, no colour, nothing that a cheap printer will render as a grey smear.

Reading down: your business name and branch, the branch's address, telephone and **PCN licence number** — which is what makes the slip acceptable to an inspector. Then the receipt number, the date and time, and **who served the customer**.

That last line matters more than it looks: when a customer returns three weeks later disputing a price, the receipt names the person who rang it up.

Each line shows the product, the quantity, and the line total, with the unit price and the **batch number** printed underneath in smaller type. The batch number is what makes a recall possible — if NAFDAC withdraws a batch you can find every customer who was sold it.

Then the subtotal, the total in bold, and how it was paid. Where a customer pays cash and the shop cannot make change, a **change-owed block** is printed at the bottom with a seven-digit claim code — explained on the next page.

The change claim slip — what the customer takes away when you cannot make change

GreenLife Pharmacy

Change Claim Slip

Claim code

4961504

Customer

Mr Tunde Alabi

Phone

08065554433

CHANGE OWED

N100.00

Present this code to collect your change, or spend it against your next purchase. If you lose this slip your name or phone number will still find it. This balance does not expire.

Running out of small notes is an ordinary Nigerian trading reality, and the usual answer — a sweet, a scribbled IOU, or simply keeping the change — loses the shop money and the customer’s trust.

PharmaRidge records it instead. The amount owed is booked as a real liability against the branch, the customer’s name or phone number is attached to it, and a **seven-digit claim code** is generated and printed. The same block also appears on the original sale receipt, so the customer has it twice.

The customer can come back and collect the cash, or spend the balance against their next purchase. **If they lose the slip** their name or phone number will still find the claim — the code is a convenience, not a condition.

Unclaimed change **never expires and is never quietly absorbed**. It sits on your books as money you owe until either the customer collects it or you, the owner, deliberately write it off — and a write-off is recorded as other income, not as a sale, so it can never flatter your trading figures.

The same sale on A4 — for a company buyer or an HMO claim

The identical sale, rendered for ordinary paper. Use it when a customer needs a document to claim against: a company account, an HMO reimbursement, a school or clinic buying in bulk.

The layout is a proper table — item, quantity, unit price, amount — under your business name and branch, with the receipt number, date and the member of staff who served it set out as labelled fields rather than squeezed onto a narrow roll.

Press **Print** and choose *Save as PDF* and you have a document you can email. Because the text is real text and not a picture, the person receiving it can search it, copy a figure out of it, and file it electronically.

A printed report — stock on hand, valuation and expiry

14 records

Powered by PharmaRidge

Every report screen in PharmaRidge carries the same **Print / PDF** and **CSV** pair, and both always export exactly what is on the screen — the same filters, the same branch, the same date range. You cannot accidentally print one set of figures and export another.

A printed report is self-describing once it leaves the screen: it carries your business name, the report title, the period it covers, and who printed it and when. Hand a page to a bank, an accountant or an inspector and it explains itself without you standing next to it.

Long reports repeat the column headings on every page — a six-page stock report where only page one is labelled is unreadable — and rows are never split across a page break. Totals are printed in a summary block at the end.

The CSV export, opened in a spreadsheet

stock-on-hand-2026-08-02.csv

Opened in a spreadsheet. Row 1 is the header the export writes.

	A	B	C	D	E
1	Product	Batch	Expires	Qty	UnitCost
2	Emzolyn with Codeine	EMZ-24E	2026-08-23	99	700
3	Amoxil 500mg	BIYRZG	2026-08-23	145	144
4	Panadol Extra	BL631T	2026-08-23	152	192
5	Amoxil 500mg	BHP3JR	2026-08-23	175	138
6	Panadol Extra	B3MAT7	2026-08-23	151	238
7	Amoxil 500mg	BDPVYJ	2026-08-23	185	198
8	Amoxil 500mg	B4B0HC	2026-08-23	144	173
9	Panadol Extra	BAZY7I	2026-08-23	151	165
10	Amoxil 500mg	BNFZ9G	2026-08-23	152	199

The same report as a spreadsheet. A PDF is for reading and filing; a spreadsheet is for reconciling, and your accountant will want the second one.

It opens natively in Excel, Google Sheets, LibreOffice and Numbers with nothing to install. Row 1 is the header the export writes; every following row is one record.

Two details that are easy to get wrong and cost real money when they are:

- **Negative numbers stay numbers.** A loss, a credit balance or a negative stocktake variance exports as `-50000`, not as text. If it exported as text, the `SUM()` your accountant runs down the column would silently skip every loss and produce a total that looks right and is wrong.
- **Naira figures and accented names arrive intact.** The file is written with a UTF-8 marker, without which Excel on Windows mangles every one of them.

Anything that could be read as a spreadsheet formula is neutralised on the way out, so a product name typed as `=cmd` cannot execute on the machine that opens the file.

11. What it costs, and what it saves

PharmaRidge is priced per day, on what you actually run: **N50 per branch per day** and **N50 per member of staff per day**.

Your pharmacy	Per day	Per month	Per year
One shop, 2 staff	N150	N4,500	N54,750
Two shops, 8 staff	N500	N15,000	N182,500
Five shops, 20 staff	N1,250	N37,500	N456,250
Ten shops, 40 staff	N2,500	N75,000	N912,500

ONE SHOP, 2 STAFF	TWO SHOPS, 8 STAFF	FIVE SHOPS, 20 STAFF
N150/day	N500/day	N1,250/day

What that means in plain terms

A single shop with two staff pays **N150 a day** — less than a sachet of paracetamol and a bottle of water. A five-branch group with twenty staff pays **N1,250 a day**, which is N250 per shop.

What your plan actually is: capacity you have already bought

Your plan is a number of **branch slots** and a number of **staff seats**. You have paid for them, so they are yours — whether or not you fill them.

- **Unused capacity is not wasted money you can claw back; it is room to grow.** If you have paid for five branches and run three, the other two are already yours: open them whenever you are ready, at no extra cost and with no waiting.
- **You cannot go past what you have paid for.** Try to open a sixth branch on a five-branch plan and PharmaRidge refuses, and tells you who to contact. That is deliberate — it stops a plan quietly growing into a bill you did not agree to.
- **Only PharmaRidge can raise the ceiling**, because raising it is a purchase. Nobody inside your pharmacy — not even the Owner — can lift their own limit. The moment support raises it, the new capacity is live: no restart, no re-installation.
- **Closing a shop frees its SLOT, not your money.** A deactivated branch releases the slot so you can open a different one in its place, and its records stay readable forever. The same is true of a staff seat when somebody leaves.
- **The support account is free.** PharmaRidge's own seat is never counted against your staff.

Your **My Plan** screen shows this as “**3 of 5 paid for**” with “2 more already paid for and ready to use”, so you can always see the capacity you own rather than guessing at an allowance.

Where the money comes back

These are not projections. They are the arithmetic of the leaks described in chapter 1.

One avoided problem	What it is worth a year
One N100 till discrepancy a day, one shop	N36,500
One N100 change claim a day, unrecorded and lost	N36,500
One N15,000 pack expiring unnoticed per branch per month, five shops	N900,000
A single N50,000 credit sale to a customer who never returns	N50,000

A five-branch group pays **N456,250** a year. Preventing expiry write-offs alone — one pack per shop per month — covers it nearly twice over.

Technical support, and what it covers

If a feature that is meant to work does not work, that is ours to fix, and support costs you nothing. Reporting a broken function is not a favour you are asking — it is the service you have paid for.

- **Anything documented in this guide is a promise.** If a screen, a calculation, a receipt or a report behaves differently from what is written here, contact support and we will correct it. You do not need to prove anything first; a description of what you did and what happened is enough.
- **Reach us however is easiest** — the phone number, e-mail and contact name on your **My Plan** screen are the live details for your deployment, and they are also printed at the bottom of every refusal message the system shows you.
- **Support can also recover you from the situations you cannot fix yourself:** an Owner locked out of their own account, a branch or staff ceiling that needs raising, a subscription question. Support can read your settings and adjust your plan.
- **Support can never move your money.** The vendor account is refused outright from every safe and till movement — that is enforced in the software, not promised in a policy.

Payment is non-refundable. Subscription payments, once made, are not refunded — including for capacity you have paid for and chosen not to use, and for any unused part of a period after a cancellation. What you are entitled to instead is that **everything works**: if a feature that should work does not, we fix it, for as long as your subscription runs. Please satisfy yourself during the demonstration period that the product does what your pharmacy needs before you pay.

Billing questions, answered plainly

Question	Answer
What exactly is counted?	Active branches and active staff accounts. A deactivated branch or a retired staff account stops counting from the day you deactivate it.
Does the support account cost me?	No. The PharmaRidge support seat is excluded from your staff count.
What if I hire for the festive season?	Add the accounts, pay for the days they exist, retire them in January. There is no minimum term on a staff seat and no penalty for removing one.
What if I move a shop instead of closing it?	Relocation keeps the branch and its history; you choose whether the new site carries the old stock and books forward or starts fresh. It is the same branch, so it is the same charge.
Is there a charge for the data?	No. Sales, stock, accounting records and the NAFDAC catalogue are all included, and your records are exportable to CSV at any time.

12. How PharmaRidge differs

Most pharmacy systems in this market fall into three groups. Here is where each one hurts, and what PharmaRidge does instead.

Against a paper book or a spreadsheet

Paper / Excel	PharmaRidge
Expiry noticed when a customer points at the box	Counted daily, warned at 90 days, oldest stock sold first automatically
Takings reconciled by memory at night	Expected cash computed continuously; the discrepancy is real when it appears
Credit written in a notebook	A limit per customer, enforced at the counter, aged by how old the debt is
No idea who served a sale	Every transaction names the person and the minute
Cannot see the second shop without driving there	Every branch on one screen, from a phone

Against a shop-counter till system

A generic POS	PharmaRidge
Knows products, not batches — so no expiry and no traceability	Batch-level stock with expiry, and nearest-expiry-first selling
No concept of prescription-only or controlled drugs	Refuses to dispense either without the details PCN expects
Stops working when the internet does	Keeps selling offline and syncs when the signal returns
Change you could not give simply vanishes	Recorded as a claim with a code, owed to a named person
Bookkeeping is a separate job at month end	Double-entry posted as you trade; the books are correct at every moment

Against imported pharmacy software

Foreign systems	PharmaRidge
Licensed per seat, per year, in dollars, paid upfront	N50/branch/day and N50/staff/day, in naira, only for what you run
Assumes reliable power and broadband	Built to keep working when neither holds
No NAFDAC catalogue, no PCN licence tracking, no PPMV concept	6,801 NAFDAC-registered products built in; PCN and PPMV licences tracked with expiry warnings
No withholding tax, or the wrong rates	The 2024 WHT schedule, both directions, editable by the Owner
Naira sign prints as a box on thermal receipts	Money written so it prints correctly on the printers actually in use
"Contact sales" to add one member of staff	Add them yourself; the cost adjusts the same day

The honest summary. PharmaRidge is not the cheapest way to ring up a sale — a till drawer and a notebook are. It is the cheapest way to stop losing money you are currently losing without noticing: expired stock, unexplained till differences, credit that was never collected, and change that nobody wrote down.

Getting started

1. **Change every PIN.** The Users screen lists any account still on the demonstration PIN.
2. **Enter your branches** with their PCN or PPMV licence numbers and expiry dates.
3. **Add your people**, each with the right role. One person, one account.
4. **Put your opening stock in** through a purchase order, so every batch has a cost, a price and an expiry from day one.
5. **Set your float and your safe.** Open the till with the cash actually in the drawer, and deposit the reserve into the safe.
6. **Set credit limits** for the customers you genuinely extend credit to. Everyone else stays cash-only, which is the safe default.
7. **Decide the permission switches** — whether managers may void and change prices, and what cashiers may correct without you.

One thing to know before you rely on it. Ask PharmaRidge support to confirm your installation has been deployed and tested on live infrastructure with your own data before you switch off your old process. Run both for a week. Any system, from any vendor, deserves that week.

Every screenshot in this guide was captured from the running application against a demonstration pharmacy with eight branches and thirty-five staff. Figures shown are that demonstration data, not a real business.
